

Apple MeetingSDK v0.9.1 Release Notes. (August 23, 2023)

NOTE:

Please see previous MeetingSDK Release Notes for an overview of what was introduced in earlier releases of the SDK.

API CHANGES

None

CHANGES/FIXES

Miscellaneous bug fixes in underlying audio and video engines

For V3 meetings, RTSP connections will now be sent to port 443. For V2 meetings, RTSP connections will remain on port 46000.

Tweaked logging for some low level events that will help debugging in the future

KNOWN ISSUES

When sharing a window into the meeting, the remote user may see the share freeze if the shared window is resized while being actively shared.

The new `previewVideoUpdated` delegate method may *not* be called when a device rotates. This will be resolved in a future SDK release.

In support of the new threading model, all delegate methods are executed on a serial `OperationQueue` that is created by the SDK. Future versions will allow you to specify an `OperationQueue` that you create (or use the main queue)

The `VideoView.isScreenShare()` API call will likely return `true` for non screen-share video streams if they are being sent at 4K resolution.

The MeetingSDK API still has a public method named `setLogFile`. This mostly duplicates the functionality in `enableActiveLogging` and will be removed in a future release.
