# Apple MeetingSDK v0.14 Release Notes. (October 24, 2023)

**NOTE:**
Please see previous MeetingSDK Release Notes for an overview of what was introduced in earlier releases of the SDK.

**API CHANGES**

In the v0.13 release, added a new `MeetingSDKDelegate` method that is called when joining a meeting that contains the JSON representation (string) of an MJWT (left in these notes until this callback is updated in the online documentation):

```
func meetingToken(decodedToken: String)
```

**CHANGES/FIXES**

Miscellaneous bug fixes in underlying audio and video engines

**KNOWN ISSUES**
When sharing a window into the meeting, the remote user may see the share freeze if the shared window is resized while being actively shared.

The new `previewVideoUpdated` delegate method may *not* be called when a device rotates.   This will be resolved in a future SDK release.

In support of the new threading model, all delegate methods are executed on a serial OperationQueue that is created by the SDK.    Future versions will allow you to specify an OperationQueue that you create (or use the main queue)

The `VideoView.isScreenShare()` API call will likely return `true` for non screen-share video streams if they are being sent at 4K resolution.
